PROFESSIONAL SUMMARY

- Over 11 years of diverse IT experience as a Java Full Stack Developer, proficient in Software Process Engineering, adept at designing and building Web Applications using Java/J2EE and open-source technologies.
- Developed enterprise web applications using Java across multiple projects, implementing complex functionalities that reduced system processing time while maintaining robust application security and scalability for high-traffic environments with thousands of concurrent users.
- Designed database architectures supporting mission-critical applications, writing advanced SQL queries and stored procedures that improved data retrieval efficiency while ensuring seamless integration with Java persistence layers across distributed systems.
- Created responsive user interfaces utilizing JavaScript frameworks for enterprise-level applications, implementing custom solutions that enhanced user experience through dynamic content loading while ensuring cross-browser compatibility and accessibility standards.
- Developed modular CSS styling systems for large-scale web applications, implementing responsive designs that maintained consistent branding across multiple device types while reducing code redundancy and improving maintenance efficiency.
- Built modern responsive interfaces using Bootstrap component libraries for enterprise applications, customizing frameworks to create intuitive user experiences while maintaining accessibility standards and ensuring consistent rendering across all major browsers.
- Implemented data persistence layers using JPA for complex enterprise applications, designing efficient entity relationships and optimizing query performance while ensuring proper transaction management and data integrity across distributed microservices.
- Engineered web services and RESTful APIs using Java and Spring framework that processed millions of requests daily, implementing comprehensive error handling while ensuring secure authentication protocols and maintaining detailed API documentation.
- Constructed complex database schemas and wrote optimized SQL queries supporting multi-tenant architectures, designing efficient indexing strategies and implementing advanced procedures that supported complex reporting requirements while maintaining sub-second query performance.
- Utilized Eclipse IDE for full-stack development across multiple enterprise projects, customizing workspaces with specialized plugins that enhanced team productivity while establishing standardized code formatting and quality control processes.

- Developed interactive web components using jQuery for enterprise applications, creating custom plugins that simplified complex DOM manipulations while ensuring optimal performance and compatibility across various browser environments.
- Configured and deployed web applications on Apache Tomcat servers across environments, implementing custom configurations that optimized memory usage and connection pooling while ensuring high availability through clustering.
- Created comprehensive test suites using JUnit and Selenium for automated testing of web applications, designing test cases that achieved comprehensive code coverage while implementing continuous integration pipelines that enforced quality standards.
- Implemented CI/CD pipelines using AWS cloud services including CodeCommit, CodeBuild, and CodeDeploy, configuring infrastructure as code that automated deployment processes while ensuring consistent environment configurations across development stages.
- Managed project requirements and sprint planning through Jira and Confluence, creating detailed workflows that improved team velocity while maintaining comprehensive technical documentation that facilitated knowledge sharing across development teams.
- Analyzed complex business requirements to determine appropriate technology solutions, translating stakeholder needs into technical specifications while ensuring alignment with enterprise architecture standards and identifying potential integration challenges.
- Collaborated with cross-functional teams to design and implement web services that met specific business requirements, facilitating technical discussions between development and business stakeholders while ensuring solutions met performance and security standards.
- Investigated operational issues through detailed system analysis and troubleshooting, identifying root causes of production problems while implementing permanent fixes that prevented recurrence and documenting solutions for future reference.
- Communicated technical concepts effectively to non-technical users and stakeholders, creating clear documentation and presentations that translated complex systems into understandable terms while gathering valuable feedback for continuous improvement.

TECHNICAL SKILLS

Programming Languages: C, C++, Java 11, SQL, PL/SQL, Python, JavaScript, TypeScript, GoLang

Java/J2EE Technologies: Servlets, Spring, JSP, JSTL, JDBC, RMI, EJB, JFC/Swing, AWT, Applets, Multi-threading, Java Networking

Frameworks: Spring, Hibernate, Angular JS, Spring Security, Spring Boot, Spring MVC, Spring Data JPA, Spring Cloud (Netflix, Gateway), NgRx, Redux-Saga, Grunt

Web Technologies: JSP, JavaScript, jQuery, AJAX, Angular JS, Angular 2+, XML, HTML5, CSS3, ReactJS, Backbone.JS, Node JS, Express JS, Redux, Tailwind CSS, Webpack, Babel

Relational Database: Oracle 11g/12C, SQL Server 2012/2014/2016, MySQL, PostgreSQL

NoSQL Databases: MongoDB, Cassandra, DynamoDB, Redis

Web Services: SOAP 1.2, REST 2.0, JAX-WS, JAX-RPC, JAX-RS, Swagger, RESTful, GraphQL

Application/Web Servers: Apache Tomcat 8.0, Oracle/BEA WebLogic, Apache CXF, IBM WebSphere

Messaging: RabbitMQ, IBM MQ, Apache Kafka

IDEs: Eclipse, IntelliJ 2017.1, Spring Tool Suite (STS) 3.9.3, Atom, PyCharm, Visual Studio

Cloud Environments: Azure, AWS, GCP, Netflix Eureka, Kubernetes, Elastic Beanstalk, Docker, OpenShift, MLops (MLairflow, DVC), RedHat, OpenShift

Methodologies: Agile (SAFe 6.x), Waterfall, TDD (Test-Driven-Development), Scrum

Testing Technologies/Tools: JUnit, Postman, TestNG, Mockito, Cucumber, JMeter, RFT, React Testing Library, Cypress, Jasmine, Karma, LEX

Version Control: Git, Bitbucket, SVN, Rational ClearCase

Build Tools: Maven 3.3.9, Gradle 3.4.1, Ant 1.10, Jenkins

Platforms: Windows 10, UNIX, Linux

Security Technologies: OAuth2, JWT, Spring Security, HTTPS, TLS, AES

Performance and Monitoring Tools: Prometheus, Grafana, AWS CloudWatch, JVisualVM, Log4J, Logstash, Elasticsearch, Kibana, JIRA

PROFESSIONAL EXPERIENCE

Client: Cigna Healthcare Bloomfield, CT

Sr. Full Stack Java Developer Dec 2021 – Present

- Developed secure healthcare data management system using Java and Spring Boot, creating RESTful microservices that integrated with legacy systems while ensuring compliance through custom annotations for data validation and sanitization.
- Built comprehensive healthcare provider portal utilizing Spring MVC and Hibernate for seamless data persistence, enabling professionals to access records securely while implementing advanced caching strategies that reduced database load during peak hours.
- Created real-time monitoring dashboards with JavaScript and Bootstrap, designing responsive interfaces that displayed critical metrics and schedules with custom components specifically designed for healthcare workflows.
- Implemented continuous integration and deployment pipelines using AWS CodeBuild, AWS CodeDeploy, and Jenkins, enabling rapid delivery of application updates while configuring automated security scans and compliance checks before production deployment.

- Maintained RESTful APIs with Swagger documentation for interoperability between different healthcare systems, facilitating seamless data exchange between departments while implementing versioning strategies to ensure backward compatibility.
- Executed comprehensive testing strategies using JUnit and Selenium, achieving over 90% code coverage for critical applications while designing custom extensions to simulate domain-specific scenarios for robust workflow validation.
- Optimized SQL queries and designed stored procedures in Oracle databases to enhance performance of healthcare record retrieval and billing processes using advanced tuning techniques for high-volume transactions.
- Deployed containerized microservices using Docker and Kubernetes for scalable applications, ensuring high availability during peak hours while configuring health checks to monitor service dependencies.
- Integrated OAuth authentication framework with AWS IAM to secure protected information across multiple applications, implementing custom policies to enforce least privilege access controls for different user roles.
- Configured logging and monitoring solutions using ELK Stack and AWS CloudWatch to track system performance and detect potential security breaches, setting up custom alarms for critical metrics and compliance issues.
- Utilized DynamoDB and Amazon S3 to build scalable document storage solution that supported quick retrieval of records while implementing versioning to maintain complete history.
- Developed healthcare inventory management system using Spring Data JPA and PostgreSQL, creating efficient data models for tracking supplies across multiple locations with optimized repository methods.
- Implemented comprehensive logging with Log4j and Logback for audit trails of all sensitive data access, ensuring compliance with regulations while creating custom appenders to format logs specifically for compliance audits.
- Managed version control using Git and AWS CodeCommit for application codebases, implementing branch protection rules and code review processes while establishing workflows aligned with enterprise software development requirements.
- Integrated Postman and SonarQube into development workflow to ensure API testing coverage and code quality standards, creating automated test collections that validated domain-specific data formats and regulatory compliance requirements.
- Designed distributed caching solutions using Redis for applications, implementing cache invalidation strategies that maintained data consistency while significantly reducing database load for frequently accessed information.
- Configured Apache Tomcat servers for web applications, optimizing JVM settings and connection pools to handle peak traffic while ensuring proper session management for secure user access.
- Implemented Microservices architecture, designing service boundaries around business domains while creating resilient communication patterns between services using circuit breakers and retry mechanisms.

- Developed data migration strategies for legacy systems, creating ETL processes that preserved data integrity while transforming records to conform with modern data standards.
- Implemented SOAP web services for integration with external healthcare providers, creating secure message exchanges that maintained data confidentiality while ensuring reliable delivery of critical information.
- Created comprehensive API Gateway solutions using AWS API Gateway for microservices, implementing request throttling and authentication mechanisms while providing unified access points for mobile and web applications.
- Developed batch processing systems for healthcare claims using Spring Batch, implementing job partitioning strategies that optimized processing of large datasets while maintaining detailed execution logs for audit purposes.

Environment: Amazon EKS, AWS CodeDeploy, Amazon S3, AWS CodeBuild, AWS IAM, AWS SNS, Kubernetes, DynamoDB, AWS EC2, AWS Cloud, Docker, AWS CloudWatch, Apache Tomcat, Oracle, pgAdmin, AWS CodeCommit, Java 11, ELK Stack, Git, Jenkins, Maven, SonarQube, DBeaver, Logback, Log4j, JUnit, JUnit 5, Spring Boot, Spring MVC, Spring Data JPA, Hibernate, JPA, JavaScript (ES6+), jQuery, HTML5, CSS3, SQL, JSON, Swagger, Selenium, Postman, RESTful APIs, Bootstrap 5, Eclipse IDE.

Client: Capital One McLean, VA

Sr. Full Stack Java Developer Mar 2019 – Nov 2021

- Designed and implemented a comprehensive financial transaction processing system using Java and Spring Boot, which handled thousands of daily transactions for institutional clients while optimizing performance through effective memory management and concurrent processing techniques.
- Developed secure RESTful APIs for integration with third-party financial data providers using JWT authentication and AWS KMS for encryption key management, documenting them with OpenAPI specifications for seamless integration with front-end applications.
- Created responsive user interfaces for financial portfolio management dashboards using JavaScript, Bootstrap, and jQuery, implementing advanced data visualization components that displayed real-time market data and portfolio performance metrics for investment advisors.
- Built and maintained a robust CI/CD pipeline using AWS CodeCommit, AWS CodeBuild, and GitHub Actions, which automated testing, security scanning, and deployment processes while incorporating Checkstyle for code quality enforcement.
- Engineered a high-availability database architecture using AWS RDS with PostgreSQL for storing sensitive financial data, optimizing query performance through indexing strategies and query refactoring to reduce report generation time for financial statements.
- Implemented comprehensive security protocols for financial data protection using AWS KMS encryption and token-based authentication, ensuring compliance with

financial industry regulations while enhancing protocols with role-based access control systems.

- Designed and deployed microservices using Kubernetes and AWS ECS to handle different aspects of the financial platform including portfolio management, risk assessment, and trade execution with auto-scaling capabilities for varying workloads.
- Developed automated testing frameworks using Selenium and JUnit that validated critical financial calculations and user workflows, including end-to-end validation of trade execution processes and regulatory compliance checks for various financial products.
- Created a comprehensive monitoring solution using Prometheus and Grafana dashboards that tracked system performance, API response times, and transaction success rates while implementing custom alerts for critical financial operations.
- Utilized AWS Lambda functions for event-driven processing of financial data streams, including real-time market data ingestion and portfolio rebalancing calculations while optimizing execution environments for high-volume transaction processing.
- Implemented data migration strategies for legacy financial systems using SQL scripts and batch processing tools, creating complex stored procedures that automated daily reconciliation processes between trading systems and accounting platforms.
- Integrated third-party financial services using XML data exchange formats and RESTful APIs, enabling features like real-time market data feeds and payment processing while developing custom parsers for various financial document formats.
- Maintained and enhanced financial reporting systems using Spring Boot and JPA for data access, optimizing entity mappings and query strategies to improve the performance of complex financial calculations.
- Configured and managed cloud infrastructure using AWS CDK and AWS Elastic Beanstalk for deploying financial applications, implementing infrastructure-as-code practices to ensure consistent deployment environments.
- Developed real-time transaction monitoring systems using AWS Cloud services and Amazon ECS for container orchestration, implementing distributed tracing with AWS X-Ray to identify performance bottlenecks in transaction pipelines.
- Created investment portfolio analysis tools using MySQL Workbench for database modeling and SQL Developer for query optimization, processing historical financial data for thousands of investment instruments.
- Engineered regulatory compliance reporting systems with Gradle build automation and JUnit for verification, deploying applications on Apache TomEE servers while implementing automated test suites to verify calculation accuracy.
- Constructed secure document management systems for financial contracts using AWS Cloud infrastructure with containerization for isolated processing environments, implementing workflow automation that significantly reduced manual processing time.

- Built customer onboarding workflows for investment accounts with document verification and compliance checks, implementing front-end components with responsive design techniques while ensuring consistent user interface elements.
- Developed real-time market data dashboards for trading desks using jQuery for dynamic content updates, deploying solutions using containerized services on Amazon ECS for horizontal scaling during high market volatility periods.

Environment: AWS Lambda, Apache TomEE, AWS CDK, AWS Elastic Beanstalk, Podman, AWS X-Ray, AWS Cloud, AWS KMS, AWS CodeBuild, AWS ECS, GitHub Actions, Git, Kubernetes, AWS RDS, Grafana, PostgreSQL, Gradle, AWS CodeCommit, Amazon ECS, Prometheus, Eclipse IDE, Spring Boot, JUnit, JUnit 4, RESTful APIs, OpenAPI, JPA, SQL, SQL Developer, MySQL Workbench, Selenium, Checkstyle, SLF4J.

Client: UPS Louisville, KY

Sr. Java Developer Jun 2016 – Feb 2019

- Designed and implemented a comprehensive logistics payroll calculation engine using Java streams and lambda expressions that processed over 10,000 employee records daily, reducing calculation time by 40% while ensuring accurate tax calculations and compliance with federal regulations.
- Developed a secure employee self-service portal using Spring Boot microservices architecture with RESTful APIs for seamless integration with third-party benefit providers, implementing OAuth authentication through AWS Cognito and Keycloak for robust security.
- Created and optimized complex SQL queries for payroll data extraction and reporting, implementing stored procedures in MySQL that handled time-sensitive payroll processing requirements while utilizing advanced join operations and indexing strategies.
- Built responsive front-end interfaces using JavaScript, HTML, and CSS with Bootstrap for cross-browser compatibility, creating interactive dashboards for payroll administrators to monitor processing status in real-time through advanced DOM manipulation techniques.
- Established a CI/CD pipeline using AWS CodeCommit, AWS CodeBuild, and AWS CodeDeploy for automated testing and deployment, implementing rigorous code quality checks using PMD and SonarQube to enforce standards and identify security vulnerabilities.
- Configured and managed containerized applications using Docker and Kubernetes on Amazon EKS, ensuring high availability and scalability during peak payroll processing periods while implementing resource limits to prevent contention during high-traffic periods.
- Integrated third-party tax calculation services through JPA and Hibernate for accurate tax withholding calculations across multiple jurisdictions, implementing complex entity relationships and custom query methods to handle hierarchical tax jurisdictions.

- Engineered comprehensive test suites using JUnit and Mockito achieving over 85% code coverage, while implementing Selenium WebDriver for end-to-end testing of critical payroll workflows and creating parameterized tests for various calculation scenarios.
- Monitored application performance and errors using AWS CloudWatch and Splunk, creating custom dashboards and alerts to proactively identify issues before they impacted payroll processing while implementing detailed logging with contextual information.
- Improved legacy payroll batch processing system by migrating from Ant build scripts to modern build tools, utilizing custom task extensions to create validation steps ensuring data integrity during payroll processing and reporting workflows.
- Optimized database performance by migrating payroll data storage to AWS Aurora, resulting in faster query processing for large-scale payroll calculations while configuring clusters to handle peak processing periods with automatic scaling.
- Built containerized microservices architecture for payroll processing using AWS Fargate and Amazon EKS, configuring tasks to scale during high-demand periods and automatically reduce resources during off-peak times.
- Developed asynchronous processing system for large payroll batches using AWS SQS to handle peak processing periods, implementing dead-letter queues to capture and retry failed payroll transactions with proper error handling.
- Implemented RESTful API services using Spring Boot and deployed them on Apache Tomcat servers, configuring connection pools and resource allocation to handle concurrent requests during high-volume payroll processing periods.
- Migrated legacy payroll system to cloud-native architecture on AWS Cloud, resulting in significant reduction in processing time while utilizing multiple services to create a scalable solution that automatically adjusted resources based on demands.
- Created custom reporting engine using CSS and HTML to generate professional payroll documents and tax forms, implementing responsive design principles ensuring reports displayed correctly across different devices.
- Configured high-availability deployment architecture using Apache Tomcat clusters behind load balancers, implementing session replication across instances to maintain user state during failover scenarios.
- Designed comprehensive audit logging system for tracking all payroll transactions and changes, storing data in AWS Cloud compliant storage with retention policies while implementing encrypted transmission and storage.

Environment: AWS CodeCommit, MySQL, IntelliJ IDEA, AWS Cloud, Amazon EKS, Ant, AWS CodePipeline, Git, AWS Cognito, Docker, AWS CodeBuild, AWS CloudWatch, Apache Tomcat, AWS SQS, Splunk, AWS Fargate, Kubernetes, PMD, AWS Aurora, Keycloak, Spring Boot, Jira, Confluence, GitLab CI/CD, AWS CodeDeploy.

Client: American Airlines **Fort Worth, TX**
Java Developer Sep 2014 – May 2016

Environment: Java 8, Spring MVC, Maven, AngularJS, jQuery, AJAX, CSS, JAX-RS, JUnit, MongoDB, Oracle, AWS (S3, EC2, RDS)

Client: HCL Technologies Chennai, India

Java Developer Jun 2013 – Aug 2014

- Developed Single Page Applications (SPA) using the AngularJS Framework.
- Created AngularJS modules to dynamically update pages based on data from REST services.
- Developed responsive web layouts that elegantly adapt to varying screen sizes using HTML media queries.
- Designed front-end screens with JSP, JSTL, Servlets, HTML, JavaScript and jQuery.
- Developed data-formatted web applications and deployed scripts with client-side scripting using AngularJS. Leveraged advanced jQuery, AJAX, AngularJS, and CSS layouts.
- Implemented the entire application using Core Java, Java Collections, and the Spring MVC design framework.
- Managed and maintained MongoDB and MySQL databases, performing routine data integrity checks and optimization for high-volume transactions.
- Participated in code reviews, actively applying JUnit best practices to improve code quality.

Environment: AngularJS, HTML, CSS, JavaScript, jQuery, AJAX, JSP, JSTL, Servlets, Core Java, Java Collections, Spring MVC, MongoDB, MySQL, JUnit

EDUCATION

Bachelor of Technology, Computer Science June 2009 - April 2013
