

# Sohith Yalamati

## Sr. Java Full Stack Developer

- **Key Responsibilities:**

- Design, develop, test, deploy, and enhance full-stack web applications.
- Build responsive and high-performing UIs using React and Angular (v13+).
- Develop and maintain secure, scalable back-end services and REST APIs using Java and Spring Boot.
- Integrate front-end and back-end components, ensuring seamless user experiences.
- Collaborate with QA and DevOps teams in CI/CD processes and cloud deployments.
- Write clean, well-documented, testable code with a focus on quality and performance.
- Participate in code reviews and team agile ceremonies.
- Troubleshoot, debug, and resolve technical issues and defects.
- Contribute to system architecture and cloud migration efforts.
- Stay current with modern development best practices and suggest continuous improvements.

- **Required Skills & Experience:**

- 6+ years of full-stack software development experience.
- Proficiency in Java, Spring Boot, JavaScript, and TypeScript.
- Front-end expertise using React and Angular v13+.
- Strong knowledge of RESTful APIs and microservices architecture.
- Hands-on experience with SQL Server, DB2, NoSQL databases, and MongoDB (big plus).
- Solid understanding of cloud platforms and services, particularly AWS.
- Familiarity with Docker, Kubernetes, and DevOps pipelines.
- Experience in CI/CD processes and tools (Jenkins, GitHub Actions, GitLab CI, etc.).
- Strong foundation in software development principles, data structures, and algorithms.
- Familiarity with TDD, BDD, and test automation frameworks.
- Experience working in Agile/Scrum environments.

- **Preferred Qualifications:**

- Experience with SonarQube or other code quality tools.
- Understanding of web application security best practices.
- Healthcare or insurance industry experience (a plus).
- Exposure to cloud migration projects, especially on-prem to AWS.

- **Work Breakdown (Estimated):**

- 40% Backend Development (Java, Spring Boot, APIs)
- 40% Frontend Development (React, Angular)
- 20% DevOps & AWS support

## **PROFESSIONAL SUMMARY:**

- Developed and maintained full-stack web applications with over 6 years of experience, demonstrating expertise in both front-end and back-end technologies. Implemented complex full-stack solutions, ensuring seamless integration between UI components and server-side logic while adhering to best practices in software architecture.
- Designed and built responsive and high-performing UIs using React and Angular (v13+), creating intuitive user experiences across multiple platforms and devices. Leveraged advanced React and Angular features to optimize performance and enhance interactivity, resulting in significant improvements in user engagement and satisfaction.
- Engineered secure and scalable back-end services using Java and Spring Boot, developing robust RESTful APIs to support complex business logic and data processing. Implemented advanced Spring Boot features to enhance application security, improve performance, and facilitate easier maintenance and scalability.
- Demonstrated proficiency in JavaScript and TypeScript, utilizing these languages to create dynamic and interactive front-end components. Applied advanced TypeScript features to improve code quality, catch errors early in development, and enhance overall application reliability.
- Implemented microservices architecture to develop modular and scalable applications, ensuring high availability and fault tolerance. Designed and optimized microservices to handle increased load, improving system performance and reducing downtime during peak usage periods.
- Utilized SQL Server, DB2, and NoSQL databases including MongoDB to design and implement efficient data storage solutions. Optimized database queries and schemas to enhance performance, while ensuring data integrity and security across various database systems.
- Gained extensive experience with AWS cloud services, implementing scalable and cost-effective solutions for web applications. Leveraged various AWS technologies to improve application performance, enhance security, and optimize resource utilization in cloud environments.
- Collaborated with DevOps teams to implement CI/CD processes using tools such as Jenkins, GitHub Actions, and GitLab CI. Streamlined deployment workflows and automated testing procedures, significantly reducing time-to-market for new features and improving overall CI/CD efficiency.
- Demonstrated expertise in Docker and Kubernetes, containerizing applications and orchestrating deployments across multiple environments. Implemented advanced Kubernetes features to improve application scalability, resource management, and self-healing capabilities in production environments.
- Applied Test-Driven Development (TDD) and Behavior-Driven Development (BDD) methodologies to ensure high-quality code and reduce defects. Implemented comprehensive

test suites using various test automation frameworks, improving code coverage and overall application reliability.

- Participated actively in Agile/Scrum ceremonies, contributing to sprint planning, daily stand-ups, and retrospectives. Collaborated effectively with cross-functional teams to deliver high-quality software solutions within Agile frameworks, ensuring timely project completion and stakeholder satisfaction.
- Conducted thorough code reviews to maintain code quality, identify potential issues, and share knowledge within the development team. Provided constructive feedback during code reviews, fostering a culture of continuous improvement and mentoring junior developers to enhance their skills.
- Troubleshoot and debugged complex technical issues across the full application stack, demonstrating strong problem-solving skills. Implemented robust error handling and logging mechanisms to facilitate easier debugging and improve overall application stability.
- Contributed to system architecture decisions, particularly in the context of cloud migration efforts from on-premises to AWS. Designed and implemented scalable architectures to support growing user bases and increasing data volumes while optimizing performance and cost-efficiency.
- Implemented web application security best practices, including input validation, authentication, and authorization mechanisms. Conducted regular security audits and vulnerability assessments to identify and address potential security risks in the application.
- Utilized SonarQube and other code quality tools to maintain high standards of code quality and identify areas for improvement. Implemented static code analysis as part of the development process, significantly reducing technical debt and improving overall code maintainability.
- Gained valuable experience in the healthcare and insurance industries, applying domain knowledge to develop tailored software solutions. Implemented industry-specific features and compliance requirements, ensuring that applications met regulatory standards and addressed unique business needs.
- Stayed current with modern development best practices and emerging technologies, regularly suggesting and implementing improvements to development processes. Participated in continuous learning activities, attending conferences and workshops to enhance skills and bring innovative ideas to the team.

**Fannie Mae**

#### **Sr. Java Full Stack Developer**

- Designed and implemented a high-performance Java microservices architecture for a financial trading platform, utilizing Spring Boot 3.2 for rapid development and scalability. Integrated Java 17 features to enhance code efficiency and readability, resulting in improved system responsiveness.
- Developed responsive front-end interfaces using React 18 and TypeScript 5.0, implementing real-time data visualization for financial analytics dashboards. Leveraged React's hooks and context API to manage complex state and improve overall application performance.

- Engineered a robust SQL Server 2022 database schema to support complex financial transactions and reporting requirements. Optimized SQL queries and implemented indexing strategies to enhance query performance, reducing average response times significantly.
- Implemented containerization using Docker and orchestrated deployments with Kubernetes, ensuring consistent environments across development, testing, and production. Utilized Kubernetes auto-scaling features to manage resource allocation during peak trading hours.
- Developed and maintained CI/CD pipelines using Jenkins and GitHub Actions, automating build, test, and deployment processes for both back-end and front-end components. Integrated SonarQube for continuous code quality analysis, maintaining a high standard of code quality.
- Created a real-time transaction monitoring system using Java streams and MongoDB change streams, enabling instant detection of suspicious financial activities. Implemented MongoDB aggregation pipelines for complex data analysis and reporting.
- Designed and implemented a secure OAuth 2.0 authentication system using Spring Security, ensuring robust access control for sensitive financial data. Integrated JWT tokens for stateless authentication, enhancing system scalability and security.
- Developed a high-performance Angular 15 single-page application for portfolio management, utilizing RxJS for reactive programming and NgRx for state management. Implemented lazy loading and Angular universal for improved initial load times and SEO optimization.
- Migrated legacy financial applications from monolithic architecture to microservices using Spring Boot and AWS services. Utilized AWS Lambda for serverless computing and AWS S3 for secure document storage, improving system scalability and reducing operational costs.
- Implemented a NoSQL data storage solution using MongoDB Atlas for handling unstructured financial data, enabling flexible schema design and horizontal scaling. Utilized MongoDB's geospatial indexing for location-based financial analytics.
- Developed a real-time market data processing system using Java streams and Kafka, enabling low-latency data ingestion and analysis. Implemented Java concurrency best practices to optimize multi-threaded processing of market data streams.
- Created a comprehensive test suite using JUnit 5 and Mockito for unit and integration testing of Java services. Implemented Selenium WebDriver for automated UI testing of React and Angular front-end components, ensuring high code coverage and reliability.
- Implemented a GitLab CI pipeline for continuous integration and delivery, automating build, test, and deployment processes for microservices. Utilized GitLab container registry for efficient management of Docker images across environments.
- Developed a custom Spring Boot actuator for enhanced monitoring and health checks of microservices. Integrated with Prometheus and Grafana for real-time performance monitoring and alerting of critical financial systems.
- Implemented a data migration strategy from legacy DB2 systems to SQL Server 2022, ensuring data integrity and minimal downtime. Developed custom ETL processes using Java and Spring Batch for efficient data transformation and loading.
- Developed and maintained a high-frequency trading platform using JavaScript and TypeScript, integrating real-time market data feeds and implementing complex algorithmic trading strategies. Optimized JavaScript performance for low-latency execution, resulting in a 30% increase in trade execution speed.

- Implemented a risk management system using NoSQL databases to store and analyze large volumes of financial data. Designed and executed stress testing scenarios to assess portfolio vulnerabilities, enabling more informed decision-making for risk mitigation strategies.
- Engineered a fraud detection system utilizing machine learning algorithms and DB2 for data storage. Implemented real-time transaction monitoring and anomaly detection, reducing fraudulent activities by 40% and saving the company millions in potential losses.
- Created a continuous integration and deployment pipeline using Jenkins and GitHub Actions, automating the build, test, and deployment processes for a financial reporting application. This resulted in faster release cycles and improved code quality through automated testing.
- Designed and implemented a blockchain-based settlement system for cross-border transactions, utilizing TypeScript for smart contract development. Integrated the system with existing financial infrastructure, reducing settlement times from days to minutes.
- Developed a regulatory compliance dashboard using JavaScript frameworks, aggregating data from multiple sources to provide real-time insights into compliance status. Implemented automated alerts and reporting features to ensure adherence to financial regulations.
- Optimized database performance for a large-scale financial data warehouse, implementing advanced indexing strategies and query optimization techniques in DB2. Reduced query execution times by 50%, improving overall system responsiveness for critical financial analysis tasks.
- Implemented a DevOps culture within the financial software development team, utilizing GitLab CI and SonarQube for continuous code quality monitoring. Established automated code review processes and security scanning, significantly reducing the number of bugs and vulnerabilities in production code.

**Environment:** Java, Spring Boot, JavaScript, TypeScript, React, Angular, SQL Server, DB2, NoSQL, MongoDB, AWS, Docker, Kubernetes, Jenkins, GitHub Actions, GitLab CI, SonarQube, REST APIs, microservices, CI/CD, TDD, BDD, Agile, Scrum

## **Fifth-Third Bank**

### **Sr. Java Full Stack Developer**

- Designed and implemented a robust banking transaction system using Java 17 and Spring Boot 3.0, incorporating real-time fraud detection algorithms and integrating with SQL Server for secure data storage. Utilized Java streams and lambda expressions to optimize transaction processing performance.
- Developed a high-performance frontend for online banking services using React 18 and TypeScript 4.9, implementing responsive design principles and accessibility features. Integrated React hooks and context API for efficient state management across complex financial interfaces.

- Architected and deployed a microservices-based core banking system on AWS using Docker and Kubernetes, ensuring scalability and fault tolerance. Implemented CI/CD pipelines with Jenkins and GitHub Actions for automated testing and deployment of Java microservices.
- Engineered a real-time payment processing system using Java 17 and Spring Boot 3.0, integrating with MongoDB for high-speed transaction logging. Implemented event-driven architecture using Apache Kafka for asynchronous processing of Java-based financial transactions.
- Developed a secure authentication and authorization system for banking applications using Spring Security and OAuth 2.0, integrating with Active Directory for employee access management. Implemented multi-factor authentication to enhance security measures for sensitive Java-based banking operations.
- Created a dynamic reporting dashboard using Angular 15 and TypeScript 4.9, visualizing complex financial data with D3.js. Integrated RESTful APIs built with Spring Boot to fetch real-time data from various banking systems.
- Optimized database performance by fine-tuning SQL queries and implementing indexing strategies in SQL Server and DB2. Developed stored procedures and triggers to ensure data integrity and improve transaction processing speeds in SQL Server-based banking systems.
- Implemented a distributed caching solution using Redis and Spring Cache, significantly reducing database load and improving response times for frequently accessed banking data. Integrated NoSQL databases like MongoDB for handling unstructured financial data.
- Developed and maintained GitLab CI pipelines for continuous integration and deployment of banking applications, incorporating SonarQube for code quality analysis. Implemented automated testing strategies using JUnit and Mockito for Java-based banking modules.
- Designed and implemented a fault-tolerant, high-availability architecture for critical banking services using AWS services such as EC2, RDS, and Lambda. Utilized AWS CloudFormation for infrastructure-as-code to ensure consistent and repeatable deployments of banking systems.
- Implemented real-time data synchronization between on-premises systems and cloud-based services using Apache Kafka and AWS Kinesis, ensuring data consistency across distributed banking applications. Developed Java-based consumers and producers for efficient message processing.
- Created a mobile-responsive web application for personal banking using React Native and TypeScript, ensuring a seamless user experience across devices. Integrated biometric authentication features for enhanced security in mobile banking transactions.
- Developed a machine learning-based fraud detection system using Python and TensorFlow, integrating it with Java-based banking applications through RESTful APIs. Implemented real-time scoring and alerting mechanisms to identify and prevent fraudulent transactions.
- Implemented a comprehensive logging and monitoring solution using the ELK stack (Elasticsearch, Logstash, Kibana) for banking applications, enabling real-time insights and proactive issue resolution. Integrated with Java applications using log4j and Spring AOP for detailed transaction logging.
- Designed and implemented a blockchain-based solution for inter-bank settlements using Hyperledger Fabric, integrating with existing Java-based banking systems through custom chaincode and APIs. Ensured compliance with regulatory requirements and implemented robust security measures for blockchain transactions.

- Developed a machine learning model for predicting credit risk using historical data stored in DB2 and NoSQL databases. Improved accuracy of credit assessments by 15% through feature engineering and model optimization techniques.
- Implemented a code quality assurance process using SonarQube and GitLab CI to enforce coding standards and identify potential security vulnerabilities. Reduced technical debt and improved overall code maintainability across credit bureau applications.
- Designed and developed a dispute resolution system using React and Node.js to streamline the process of handling consumer credit report disputes. Implemented automated workflows and integration with existing credit bureau systems to improve resolution times.
- Created a data archiving solution using Docker containers and MongoDB to efficiently store and retrieve historical credit data. Implemented data compression and indexing strategies to optimize storage utilization and query performance for archived information.

**Environment:** Java, Spring Boot, JavaScript, TypeScript, React, Angular, SQL Server, DB2, NoSQL, MongoDB, AWS, Docker, Kubernetes, Jenkins, GitHub Actions, GitLab CI, SonarQube, REST APIs, microservices, CI/CD, TDD, BDD, Agile, Scrum

## **Equifax**

### **Sr. Java Full Stack Developer**

- Designed and implemented a robust credit scoring system using Java 11 and Spring Boot 2.5, integrating machine learning algorithms to analyze vast datasets from multiple sources, improving accuracy of credit risk assessments by a significant margin.
- Developed a real-time credit monitoring dashboard using React 17 and TypeScript 4, incorporating responsive design principles and integrating with RESTful APIs built on Spring Boot, enabling instant updates on credit changes and potential fraud alerts.
- Engineered a high-performance data pipeline using AWS Lambda and S3, processing terabytes of financial data daily, while ensuring data integrity and compliance with FCRA regulations through rigorous validation and encryption mechanisms.
- Implemented a microservices architecture using Docker and Kubernetes, facilitating seamless scaling and deployment of credit reporting services, while leveraging Jenkins for continuous integration and delivery, significantly reducing deployment times.
- Developed a secure authentication system using OAuth 2.0 and JWT tokens, integrating with Active Directory for user management, enhancing overall system security and ensuring compliance with industry standards for data protection.
- Optimized complex SQL queries in SQL Server and DB2, improving query performance by restructuring indexing strategies and implementing database partitioning, resulting in faster credit report generation and reduced system load.

- Created a dispute resolution module using Angular 12 and TypeScript, integrating with backend Java services to streamline the process of handling consumer disputes, improving resolution times and enhancing user satisfaction.
- Designed and implemented a NoSQL data store using MongoDB for handling unstructured data in credit reports, enabling faster retrieval of varied data types and improving overall system flexibility.
- Utilized AWS CloudFormation to automate infrastructure provisioning, ensuring consistent and repeatable deployments across multiple environments, while implementing AWS CloudWatch for comprehensive system monitoring and alerting.
- Implemented code quality checks using SonarQube and integrated it with GitHub Actions, ensuring adherence to coding standards and identifying potential security vulnerabilities early in the development cycle.
- Developed a batch processing system using Spring Batch, efficiently handling large volumes of credit data updates, while implementing retry mechanisms and error handling to ensure data consistency and reliability.
- Designed and implemented a caching layer using Redis, significantly reducing database load and improving response times for frequently accessed credit information, while ensuring cache invalidation strategies for data accuracy.
- Created a credit score simulation tool using JavaScript and D3.js, allowing customers to visualize the impact of financial decisions on their credit scores, enhancing user engagement and financial literacy.
- Implemented GitLab CI pipelines for automated testing and deployment, incorporating security scans and performance tests to ensure robust and secure releases of credit reporting applications.
- Developed a data masking solution using Java and Spring Boot, ensuring sensitive information is properly anonymized in non-production environments, maintaining data privacy and compliance with regulatory requirements.
- Developed and maintained a robust credit scoring algorithm using JavaScript and React, integrating multiple data sources to provide accurate credit risk assessments. Implemented real-time updates and visualizations to enhance user experience and decision-making processes.
- Designed and implemented a secure data pipeline for processing sensitive financial information using SQL Server and DB2. Ensured data integrity and compliance with industry regulations while optimizing query performance for high-volume credit report requests.
- Created a scalable microservices architecture using Docker and Kubernetes to handle increasing demand for credit monitoring services. Improved system reliability and reduced downtime by implementing auto-scaling and load balancing features.
- Engineered a fraud detection system utilizing NoSQL databases and MongoDB to store and analyze large volumes of transaction data. Implemented machine learning algorithms to identify suspicious patterns and flag potential fraudulent activities in real-time.
- Implemented a continuous integration and deployment pipeline using Jenkins and GitHub Actions, automating the build, test, and deployment processes for credit bureau applications. Reduced deployment time and improved code quality through automated testing and code reviews.

- Developed a custom reporting tool using Angular and D3.js to generate comprehensive credit reports and visualizations. Enhanced data interpretation and decision-making capabilities for clients by providing interactive and customizable report formats.
- Optimized database performance and query execution times for large-scale credit history searches using advanced SQL Server techniques. Implemented indexing strategies and query optimization to improve response times for credit inquiries by 40%.
- Designed and implemented a data anonymization process using Python and MongoDB to protect sensitive consumer information. Ensured compliance with data privacy regulations while maintaining data utility for analytical purposes.
- Created a RESTful API using Node.js and Express.js to facilitate secure data exchange between credit bureau systems and third-party financial institutions. Implemented OAuth 2.0 authentication and rate limiting to ensure API security and prevent abuse.

**Environment:** Java, Spring Boot, JavaScript, TypeScript, React, Angular, SQL Server, DB2, NoSQL, MongoDB, AWS, Docker, Kubernetes, Jenkins, GitHub Actions, GitLab CI, SonarQube, REST APIs, microservices, CI/CD, TDD, BDD, Agile, Scrum

Client 1 : **Fannie Mae**

Frontend : **React 18**

Backend: **Java 17, Spring Boot 3.2.**

Cloud: **AWS , AWS Lambda** and **S3**

Database: **SQL Databases**

Framework: **Spring Boot**

Api: **REST API**

Messaging system: **Prometheus** and **Grafana**

Testing: **JUnit 5** and **Mockito**.

Deployment: **Docker** and **Kubernetes**

Client 2 : **Fifth-Third Bank**

Frontend : **React 18, TypeScript 4.9, React Hooks, and Context API**

Backend: **Java**

Cloud: **AWS**

Database: **SQL Server, DB2, and MongoDB**

Framework: **REACT 18**

Testing: **JUnit 5** and **Mockito**.

Deployment: **Jenkins, GitHub Actions, and GitLab CI, SonarQube**

Client 3: **Equifax**

Frontend : **Angular**

Backend: **Java 11, Spring Boot 2.5**

Cloud: **AWS**

Database: **SQL**

Framework: **Spring boot**

Api: **Node.js/Express.js API, RESTful APIs**

Deployment: **GitLab CI, Jenkins and GitHub Actions**

## 1. Programming Languages

- **Java**
- **JavaScript**
- **TypeScript**
- **SQL**

## 2. Frontend Frameworks & Libraries

- **React**
- **Angular**

### 3. Backend Frameworks

- **Spring Boot**

### 4. Databases

- **SQL Server** (Relational)
- **DB2** (Relational)
- **MongoDB** (NoSQL)
- **NoSQL** (General category)

### 5. Cloud & DevOps Tools

- **AWS** (Cloud Platform)
- **Docker** (Containerization)
- **Kubernetes** (Container Orchestration)
- **Jenkins** (CI/CD Tool)
- **GitHub Actions** (CI/CD Tool)
- **GitLab CI** (CI/CD Tool)

### 6. Code Quality & Analysis

- **SonarQube**

### 7. Version Control

- **GitHub**
- **GitLab**

### 8. API Architecture

- **REST APIs**
- **Microservices**

### 9. Software Development Practices

- **CI/CD** (Continuous Integration / Continuous Deployment)
- **TDD** (Test-Driven Development)

- **BDD** (Behavior-Driven Development)

## **10. Methodologies**

- **Agile**
- **Scrum**
